[Client-facing report title]

Group *[number]* | *[team members]* | 2026/27

Executive summary

[Give the recommended investment and operation, its incremental value against a feasible alternative, and the condition most likely to change the decision.]

1 Decision context and data

[State the inherited assets, sale boundary, time units and money basis. Record material input issues, repairs and quality flags. Separate data from assumptions.]

2 Tier 1. Flexibility investment

Assumptions and formulation. *[Define variables and units. Link each assumption to the brief or a source, and explain the time simplification, objective and constraints.]*

$$\max_{x \in \mathcal{X}} \quad c^\top x, \tag{1a}$$

$$\text{subject to} \quad Ax \leq b. \tag{1b}$$

Results and validation. *[Compare the four portfolios and a simple strategy with matched capacity. Separate captured surplus from displaced sales, and show independent checks.]*

Table 1. *[Decision, time period and comparison basis.]*

Scenario	Battery (MW)	Electrolyser (MW)	Gain (£m/yr)
No new capacity	0	0	0.00
Battery only	—	0	—
Electrolyser only	0	—	—
Joint choice	—	—	—
Simple rule, matched size	—	—	—

Sensitivity. *[Quantify what reverses the decision, including offtake, netback and sales priority.]*

3 Tier 2. [Selected extension, 2A or 2B]

[Explain what changes and which Tier 1 assumptions carry over. For 2A, define candidate technologies and capacities. For 2B, define chronology, what is known at each decision, and the implementable strategy. Compare to a matched reference, validate, and stress-test the extension.]

4 Recommendation

[Integrate both tiers. State the action now, the evidence for it, the conditions for expansion and the first items to verify.]
