[Client-facing report title]

Group *[number]* | *[team members]* | 2026/27

Executive summary

[State what to build, how much, and how to operate it. Give the improvement over the matched comparator and identify the condition most likely to change the decision.]

1 Decision context and data

[Define the client's starting assets, decision scope, dates and units. Describe the most material data checks and adjustments, the remaining uncertainty, and the distinction between observed inputs and assumptions.]

2 Tier 1. Flexibility investment

Assumptions and formulation. *[Define inputs, decisions and units. Explain the time simplification, technology parameters, objective and constraints.]*

$$\max_{x \in \mathcal{X}} \; c^\top x \qquad \text{subject to } Ax \leq b. \tag{1}$$

Results and validation. *[Compare the four portfolios and a simple strategy on matched terms. Separate captured surplus from displaced sales and show the checks.]*

Table 1. *[Decision, comparison basis and units.]*

Scenario	Battery (MW)	Electrolyser (MW)	Gain (£m/yr)
No new capacity	0	0	0.00
Battery only	—	0	—
Electrolyser only	0	—	—
Joint choice	—	—	—

Sensitivity. *[Test influential assumptions, including hydrogen value and electricity sales priority. Quantify where the investment decision changes.]*

3 Tier 2. [Selected extension, 2A or 2B]

[Define the chosen extension and what it carries over from Tier 1. For 2A, specify generation options. For 2B, specify chronology and information. Compare against a matched reference, validate and stress-test the decision.]

4 Recommendation

[Integrate the Tier 1 and selected Tier 2 results. State the action now, the sequence of any further investment and what the client should verify first.]
