[Client-facing recommendation]

MMCS 2026/27 | Group [number] | [authors]

[*State the chosen investment, its incremental benefit, the matched alternative and the contract or operating condition that changes it.*]

1 Decision context and data

[*Define the inherited assets, system boundary, dates, units and price basis. Record data checks, adjustments and estimate flags. Keep a short audit table in the body.*]

2 Tier 1 investment

2.1 Assumptions and model

[*Define inputs and decisions before numbered equations. State time simplification, device constraints, annualisation and each policy's counterfactual.*]

$$\max_{x \in \mathcal{X}} \quad c^\top x, \tag{1a}$$

$$\text{subject to} \quad Ax \leq b. \tag{1b}$$

2.2 Results, validation and decision thresholds

[*Compare no investment, battery, hydrogen and joint choice, then a simple rule with the same capacity. Separate captured surplus and diverted sales. Validate the schedules and test contracts, costs, data and historical conditions.*]

3 Tier 2 [chosen extension]

[*For 2A, specify generation options and investment trade-offs. For 2B, specify chronology and the information available at each decision. Carry over matched boundaries, validate and explain what the extension changes.*]

4 Integrated recommendation

[*Give the action now, a threshold for each expansion and the conditions to verify. Relate the recommendation to evidence from both tiers.*]

Writing check. [*Every quoted result has a table, figure or data source. All symbols and units are defined. Figures and tables have consistent captions and references. Equations and code agree. The physical PDF meets the ten-page budget.*]
